Preface

FORWARD

The **Clinically Drug Preferred List** is a continually updated list of prescription medications that represents the current clinical judgment of providers and experts in the diagnosis and treatment of disease. This document represents the efforts of our clinical team to provide physicians, pharmacists and members with a method to evaluate the various drug products available. The Clinically Preferred Drug List shows both the generic and brand names for reference and convenience. All applicable dosage forms and strengths of a particular drug are included in the Clinically Preferred Drug List under the specific entry unless otherwise noted. Health plans are provided the option of imposing further restrictions or may choose not to reimburse some products listed in the Clinically Preferred Drug List.

COVERAGE LIMITATION

The **Clinically Preferred Drug List** does not provide information regarding the specific coverage and limitations a member may have, including specific exclusions, copays, or a lack of coverage that is not reflected in the Clinically Preferred Drug List. The Clinically Preferred Drug List applies only to outpatient drugs provided to members, including most specialty injectable drugs and **does not** apply to medications used in the in-patient setting or many injectables administered in a physician's office. Injectable drug coverage is determined by individual plans and may not be included for all members. **Note: if a drug is covered and listed as “preferred”, all strengths and forms of that drug are considered preferred unless specifically listed.**

DESI DRUGS

DESI (Drug Efficacy Study Implementation) designated drugs are those drugs first marketed between 1938 and 1962 that were approved as safe but were not required to prove effectiveness for FDA product approval. In 1963, Congress passed the Kefauver-Harris Amendment, which required that manufacturers of drug products provide proof to the FDA of both safety and effectiveness before the product could be marketed. The DESI Program was implemented to determine which of the drugs approved between 1938 and 1962 could indeed claim, in clinical trials, effectiveness for their specific indications.

DESI drugs, and those identical, related and similar to them, may continue to be marketed until studies and administrative proceedings regarding their effectiveness have been concluded. Once the proceedings are concluded, continued marketing of the drug will only be permitted once a New Drug Application (NDA) is approved by the FDA. New Drug Applications must contain data from clinical trials demonstrating that a medication is both safe and effective for the specified indication. Many health plans do not cover DESI designated medications, as their effectiveness has not been proven for the condition that the product is marketed to treat.

Preface (Continued)

SELECTION PROCESS FOR THE CLINICALLY PREFERRED DRUG LIST

New agents are continually being developed and approved by the FDA for the treatment of different disease states. Due to the availability of numerous medication therapies and treatments, a process of drug selection and drug usage has been developed.

The development, maintenance, and improvement of the Clinically Preferred Drug List are processes that require the attention of our Pharmacy & Therapeutics (P&T) Committee. The Clinically Preferred Drug List is a continually reviewed and revised list of drug products that mirrors the prevailing clinical opinion of the P&T Committee.

New agents being considered for formulary inclusion will be reviewed for their safety, efficacy, FDA-approved indications, contraindications, side effects, pharmacokinetic profile, patient compliance potential, drug cost and effects on other indirect health costs. The thorough medical literature review conducted by the P&T Committee places emphasis on the following characteristics:

- Safety and effectiveness of the product
- Comparison studies with similar products if available
- Potential for patient clinical or utilization abuse
- Therapeutic outcomes and pharmacoeconomic data

Agents that are given a "priority" review by the FDA will be immediately reviewed for possible inclusion into the formulary. New drugs will have their characteristics compared to other similar agents within a therapeutic class if possible. New drugs that are added to an existing therapeutic class may result in the deletion of other drug(s) within a particular therapeutic class as clinical application warrants. This process ensures and promotes the selection of the most clinically useful and cost-effective agents within a specific therapeutic class.

GENERIC SUBSTITUTION

Whenever available, FDA approved generic drugs considered bioequivalent with the respective brand name drug should be used regardless of the brand name indicated. Greater economy is realized using generic equivalents. This policy is not meant to preclude any state statutes that may exist (e.g., Non-Substitutable Drugs). Inclusion of a drug product for generic substitution is subject to the following: FDA Rating of "A" for generic equivalency, denoting bioequivalency, as well as thorough review by the P&T Committee for efficacy and safety.

SPECIALTY PHARMACY PRODUCTS

Depending on drug coverage parameters regarding injectable medications, which is often the route of administration of specialty products, categories of drugs covered will generally include the specialty pharmacy products although these products often require prior authorization and higher copayments due to complexity of therapy and high costs.
